

1 What is a tidal flow artificial wetland that purifies polluted water?

An artificial wetland is an eco-friendly water treatment system that uses the natural self purification processes of ecosystems. Through the activities of living organisms, polluted water is purified. This creates a beautiful life where people and nature coexist in harmony.

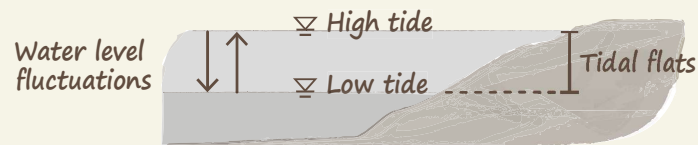

Now, let's see how wastewater is purified in a tidal flow artificial wetland!

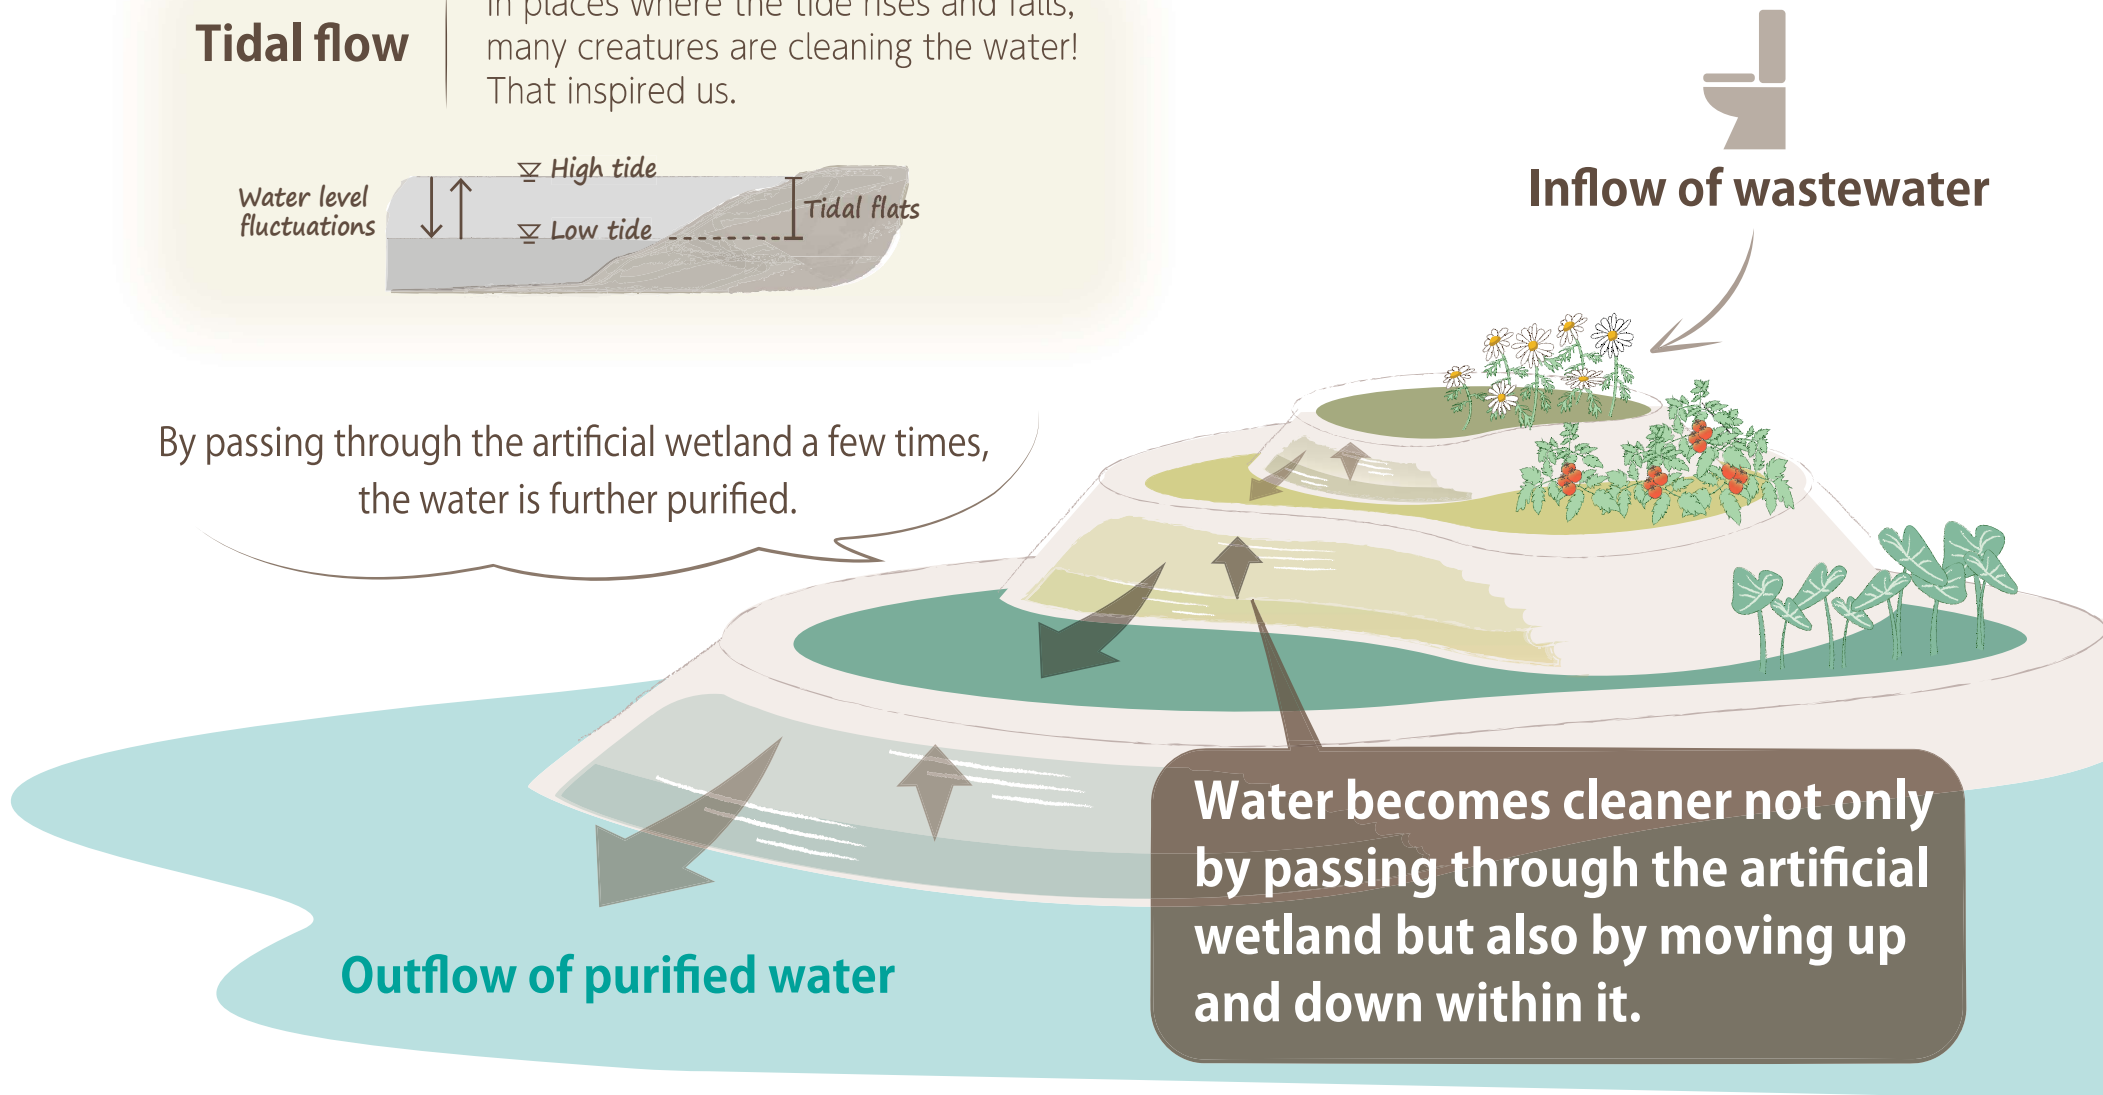

2 Why tidal flow?

Tidal flow

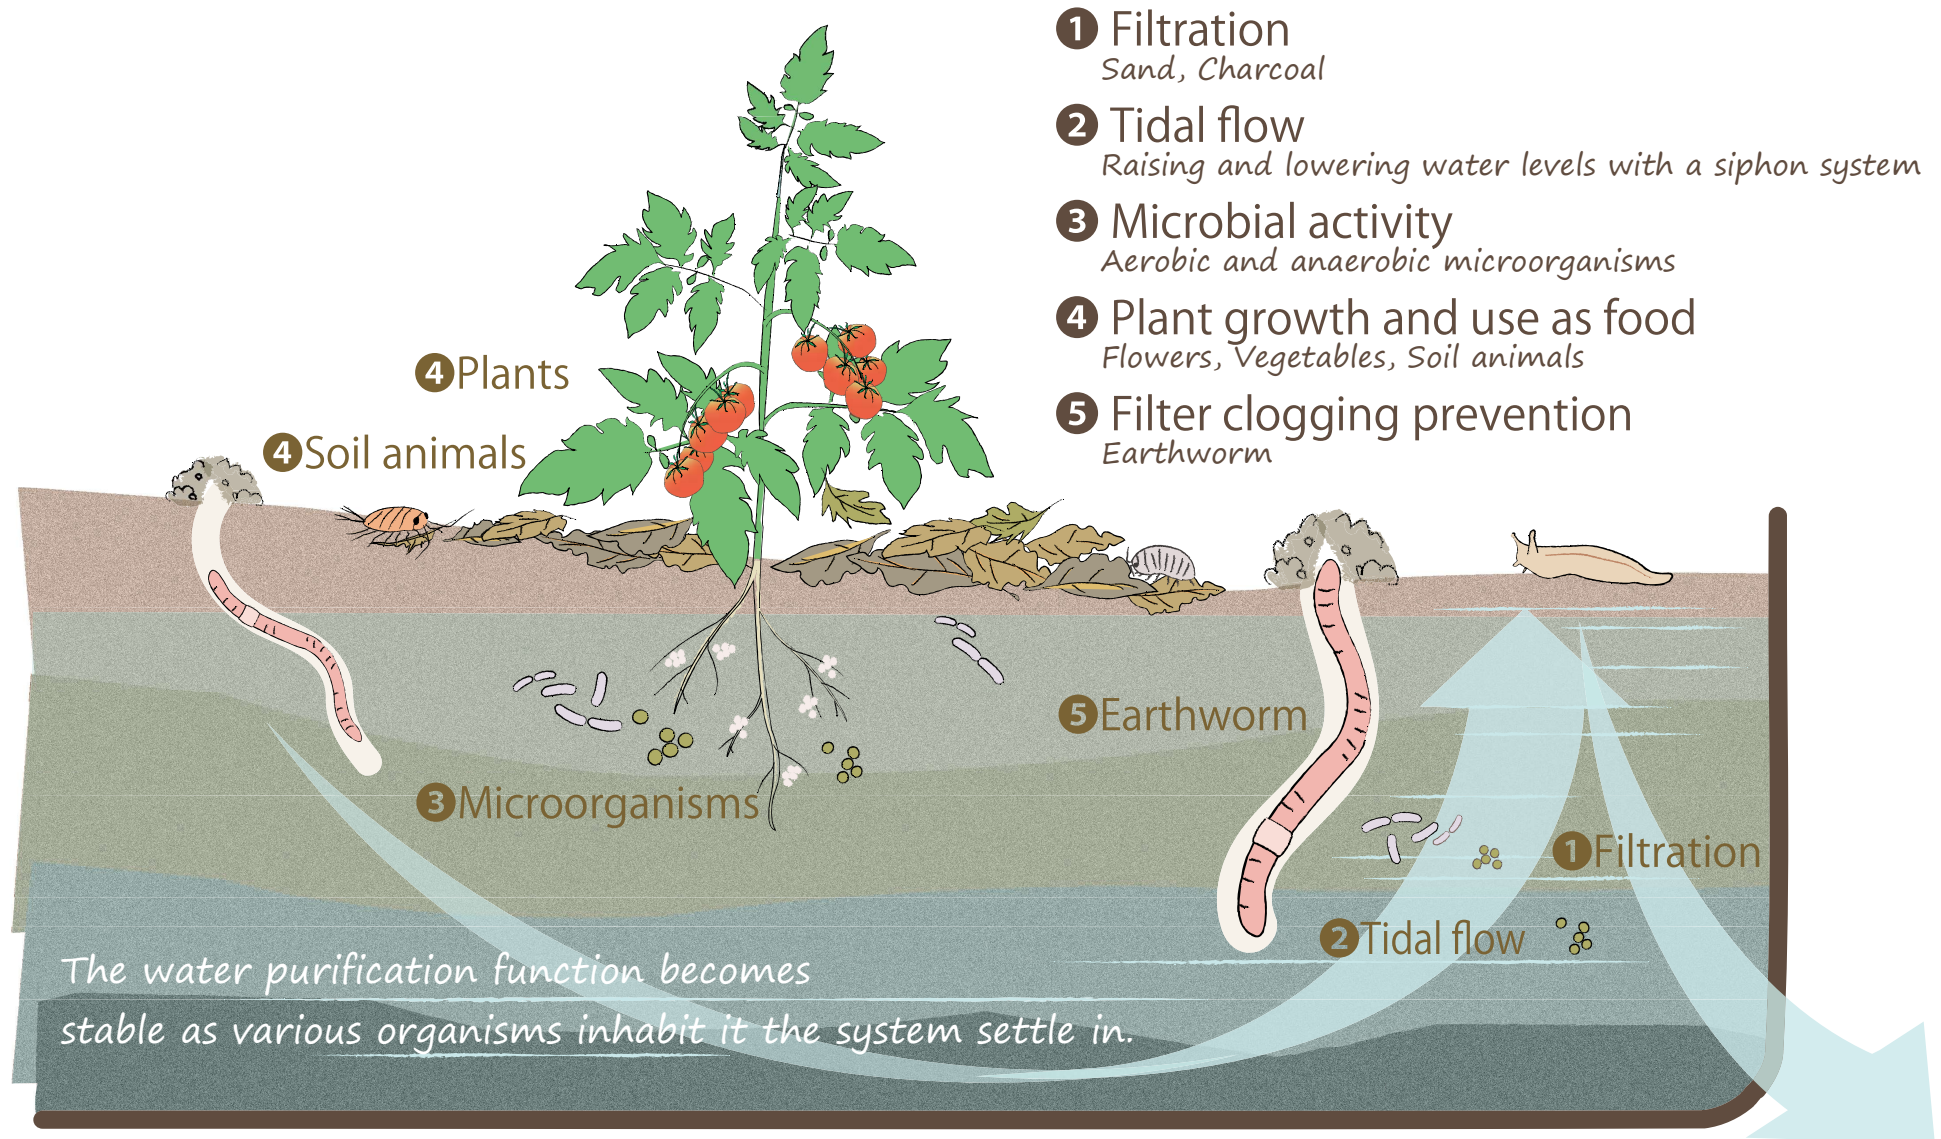

In places where the tide rises and falls, many creatures are cleaning the water! That inspired us.

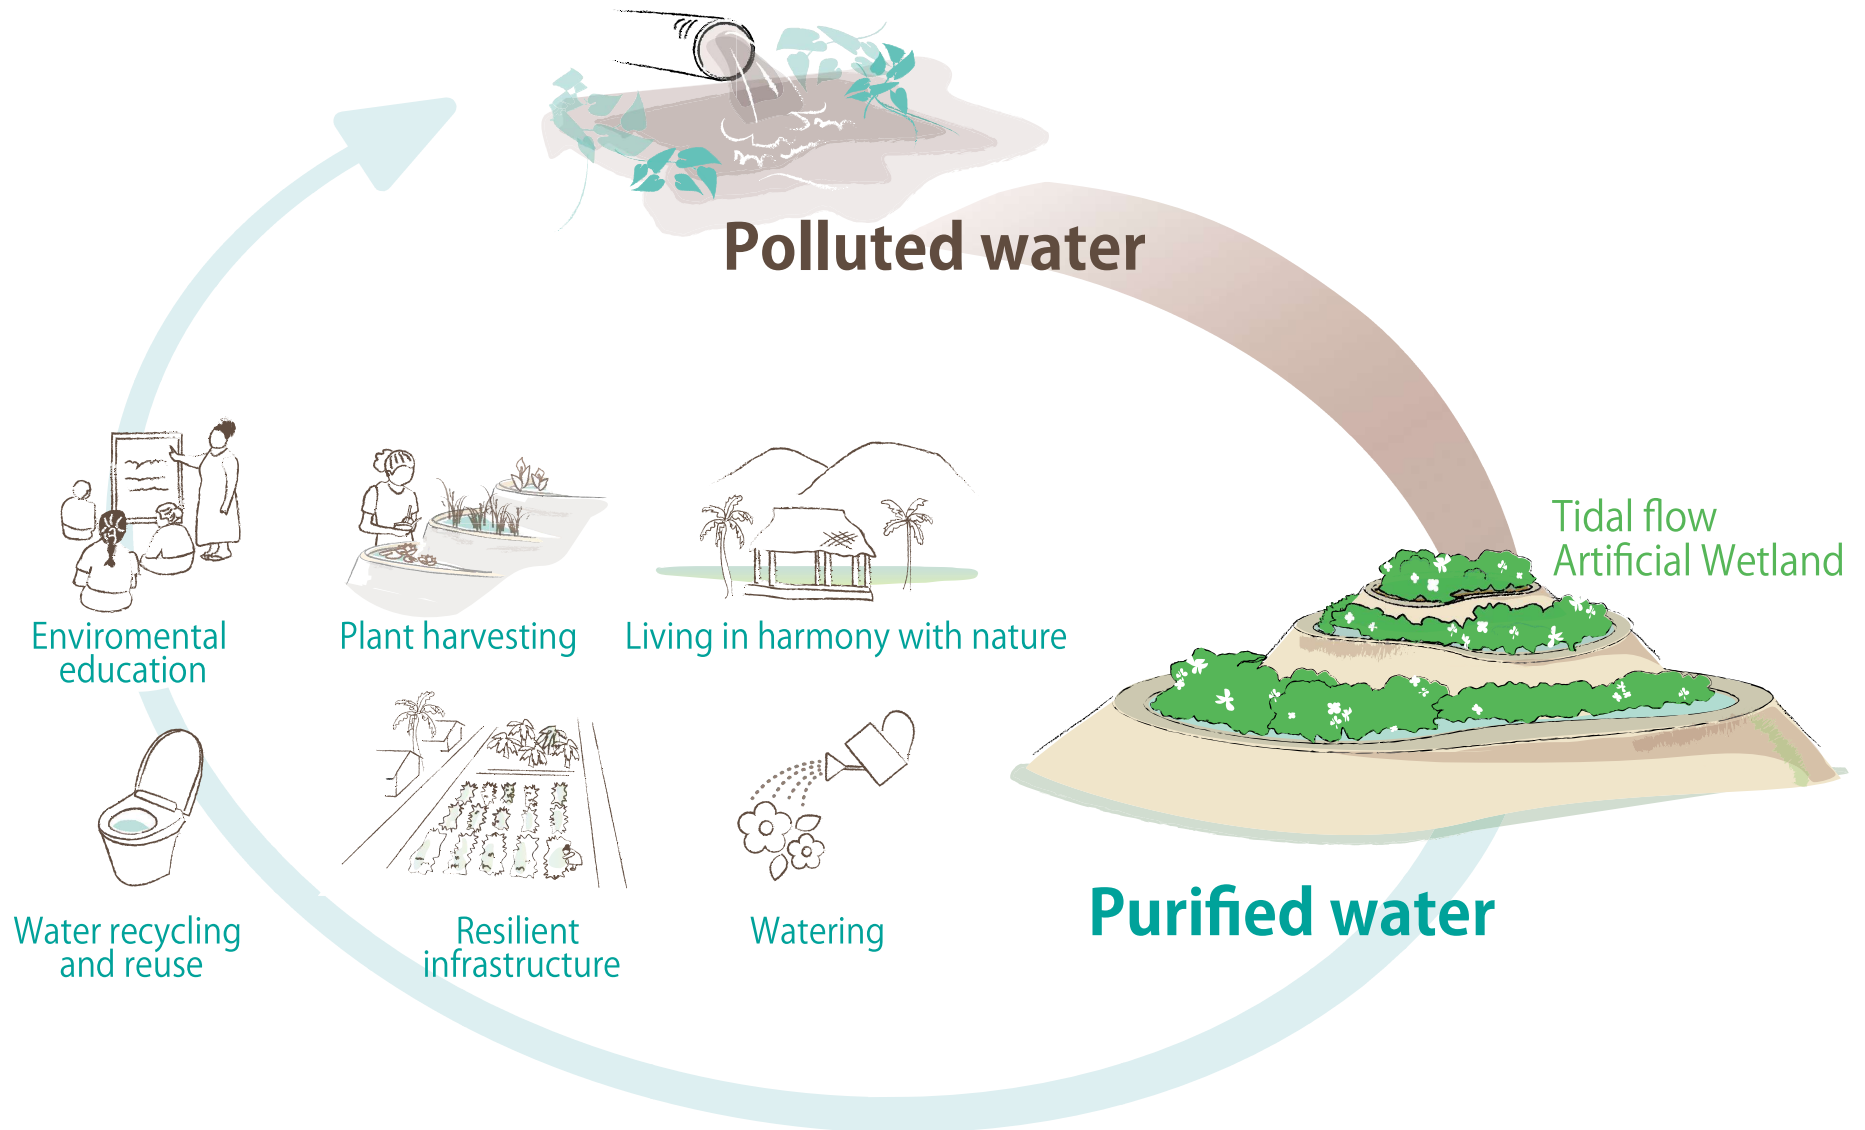

By passing through the artificial wetland a few times, the water is further purified.

3 How do artificial wetlands work?

4 Artificial wetlands are beneficial in many ways

5

The tidal flow artificial wetland is a system good for people and nature!
